

Geospatial Information Systems

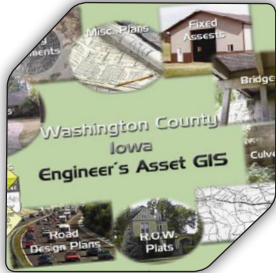

Aerial Services' geospatial professionals not only offer acquisition and processing, but can follow through with implementation of a Geographical Information System (GIS) solution that best fits your needs. These services provide you with a full-service solution from one quality provider.

The Information Problem

With increasing access to more geospatial information, many find trying to make sense of data overwhelming. Knowing how to integrate, access, and organize your data and mapping products is a challenge.

Easy To Use Solutions

Aerial Services creates solutions that organize, integrate, and enhance your data. This saves you time and money while increasing your ability to be effective.

Aerial Services' complete Asset GIS solution has been featured in *American Surveyor Magazine*.

E-Docs Asset GIS

Instead of leafing through thousands of design drawings, maps, photographs, and forms to find one document, deploy Aerial Services' Instant Asset GIS. This system allows everyone within your organization to instantly find your data and eliminates paper file searches. The Instant Asset GIS design organizes your assets into a central location accessible via an internet browser. Additionally, these assets can be tied to a geographical map and orthophotography. Everything you need is available with the click of a mouse.

Data Conversion And Archival

Using high-speed scanners, Aerial Services converts all of your existing large- and small-format paper documents into digital form and stores them inside dynamic high-performance databases. File drawers full of paper forms, cabinets of maps, and design drawings are compressed and become accessible in a number of common GIS packages.

Custom Software Development

When off-the-shelf software fails to provide the solution you need, Aerial Services' programmers customize software to your specifications and design a solution that works best for your application.

Custom solutions such as the Waukee Schools' Bus GIS can be created for your application.

Also see our "E-Doc Asset GIS" and "School Bus GIS" case studies for more information. Imagine the possibilities for your organization!
